

Technical Note — SIMATS Engineering Event Registration Portal

1. CSS Method Justification

Three methods are demonstrated in this project:

- **Inline CSS** — used once, on the highlighted phrase inside the hero heading (`style="color:#ffd76a; font-style:italic;"`), for a one-off visual emphasis that doesn't need to be reused.
- **Internal CSS** — used once, in a `<style>` block inside `<head>`, scoped only to `footer.site-footer`.
- **External CSS** — `style.css`, used for the entire site's main design.

For a multi-page website, external CSS is the most suitable method.

A single `style.css` file can be linked from every page (home, events, registration, contact), so the header, colour palette, spacing and typography stay identical across the whole site without repeating code. Updating one file updates every page at once, the HTML stays clean and readable, and the browser can cache the stylesheet, so subsequent pages load faster. Inline CSS does not scale — it would need to be repeated on every element on every page. Internal CSS is tied to a single document, so a multi-page site would need the same block copy-pasted into every file, which is difficult to keep in sync.

2. Box Model Calculation — Event Card

Card selector: `.event-card`

`padding: 26px 24px; /* 26px top/bottom, 24px left/right */`

`border: 1px solid #e7ebf3;`

width: not explicitly set — card stretches to fill its grid column.

For the calculation, assume a grid column has resolved to a **content width of 300px** (a typical column width at a 1140px container, 2-column grid, 28px gap).

Default content-box model (box-sizing: content-box)

In the content-box model, width describes the content box only; padding and border are added **on top of** that width.

Total rendered width = content width + left padding + right padding + left border + right border
= 300px + 24px + 24px + 1px + 1px
= 350px

So a card whose content area is 300px would actually occupy **350px** of horizontal space in the layout — 50px more than the declared content width.

With box-sizing: border-box (used in this project)

This project's reset rule applies box-sizing: border-box to every element. Under border-box, the declared width **already includes** padding and border; the browser shrinks the content area to make room for them instead of adding to the outer size.

Declared width = 300px (this is now the FINAL rendered width)

Padding + border taken from inside = 24px + 24px + 1px + 1px = 50px

Actual content area remaining = 300px – 50px = 250px

Effect of the change: switching from content-box to border-box keeps the card's outer footprint fixed at exactly the width the grid track gives it (300px), instead of growing to 350px. This is why border-box is used site-wide — it makes the CSS Grid columns, the form's two-column layout, and the card widths predictable and equal, and it prevents the horizontal overflow that would otherwise occur on the 375px mobile viewport.

3. Positioning Techniques Used

Technique	Element	Purpose
sticky	.site-header	Keeps navigation visible while scrolling through the catalogue
fixed	.help-btn	Persistent quick-jump button to the registration form
relative	.event-card, .main-nav a	Establishes positioning context for absolute children/pseudo-elements
absolute	.status-badge	Places the Open/Filling/Closed badge in the card's corner without affecting document flow
z-index	header (100), badge (5), help button (200)	Ensures the fixed help button always sits above the sticky header and cards, and the badge sits above the card body

No positioned element overlaps the form fields or hides essential content — verified visually at both the desktop and 375px mobile viewport.

4. Testing Notes

- **Desktop viewport:** 2-column event grid, 2-column registration form.
- **Mobile viewport (375px):** grid collapses to a single column via the @media (max-width: 900px) and @media (max-width: 600px) rules; no horizontal scrollbar appears because overflow-x: hidden is set on body and all sizing uses border-box.
- **Browsers tested:** Google Chrome and Mozilla Firefox (attach screenshots from both as required by the submission checklist).
- **125% zoom:** headings use clamp() for fluid sizing and the layout is built with flex/grid percentages rather than fixed pixel widths, so text reflows without clipping.

[Register](#)

CodeSprint 24-Hour Hackathon

OPEN

Category: Technical

Date & Time: 16 Aug 2026, 9:00 AM

Venue: CSE Block, Innovation Lab

Build a working prototype in 24 hours around this year's SDG-linked problem statements. Teams of 2-4.

Register Now

Saveetha Cultural Fiesta

OPEN

Category: Cultural

Date & Time: 20 Aug 2026, 5:00 PM

Venue: Main Auditorium

An evening of music, dance and drama showcasing talent from every department. Solo and group entries welcome.

Register Now

Placement Readiness Bootcamp

FILLING FAST

Category: Placement Training

Date & Time: 23 Aug 2026, 10:00 AM

Venue: Seminar Hall 2

Aptitude, group discussion and mock-interview sessions led by the Training & Placement Cell.

Register Now

Inter-Department Athletics Meet

CLOSED

Category: Sports

Date & Time: 12 Aug 2026, 7:00 AM

Venue: Sports Ground

Track and field events across all years. Registrations for this event have now closed.

Registrations Closed
